

## Remember Version 1 Python Reflection

Q1 Identify the token kind (operator, delimiter, str literal, int literal, float literal, identifier, keyword etc.) for each token in this Python statement:

Q2 Scan Remember Version 1 and write down an example for each of the following statement types.

Statement Type	Example
import	<code>import time</code>
expression	<code>print(content)</code>
assignment	<code>filemode = "r"</code>

Q3 Each bolded and underlined token in the following Python statements is either a keyword or an identifier. Either indicate that it is a keyword or, if it is an identifier, indicate the "type" of object it is bound to:

Python Statements	Type of the Identifier or Keyword
<code>import <u>time</u></code>	identifier module
<code><u>import</u> time</code>	keyword
<code>time.<u>sleep</u>(2)</code>	identifier function
<code><u>print</u>('chair')</code>	identifier function
<code>print('Sorry, you entered ' + <u>player_word</u>)</code>	identifier str
<code><u>input</u>('Press enter to display the words.')</code>	identifier function

**Q4 For EACH of the following Python statements, write the type of object the underlined expression evaluates to:**

Statement	Type of Object
<u>time.sleep(2)</u>	<b>NoneType</b>
player_word= <u>input('What word begins with the letter c?')</u>	<b>str</b>
<u>print('orange')</u>	<b>NoneType</b>
<u>input('Press enter to display the words.')</u>	<b>NoneType</b>

**Q5 In each of the following function calls, identify the argument and the type of object the argument is bound to.**

Statement	Argument	Type
print('mouse')	<b>'mouse'</b>	<b>str</b>
time.sleep(2)	<b>2</b>	<b>int</b>
input('Press enter to display the words')	<b>'Press enter to display the words'</b>	<b>str</b>

**Q6 Suppose you have an alternative instructions file, alt\_instructions.txt, that says the player has 3 attempts to guess the word properly. Edit the relevant parts of your code so that the alternative instructions will be displayed.**

**filename = "alt\_instructions.txt"**
